Abstract.—This report presents juvenile salmonid emigration monitoring data conducted in 2011 at both Pear Tree Bar (PTRST; river kilometer [rkm] 118) and Willow Creek (WCRST; rkm 34), California on the mainstem Trinity River. Monitoring at PTRST is conducted to estimate juvenile salmonid population size passing PTRST during the sampling season. Monitoring at WCRST is conducted to estimate juvenile salmonid population size and emigration timing during the monitoring period. In 2011, two rotary screw traps were operated at PTRST from January 13 through August 26, with successful sampling for 206 of the 226 day sampling period. At WCRST three rotary screw traps were operated in 2011 from March 5 through September 16, with successful sampling for 163 days of the 195 day sampling period.

Age of salmonid outmigrants, mean length by week, migration rates, and hatchery contributions were estimated. Catch data were used to calculate proportional discharge based abundance indices for juvenile Chinook salmon (*Oncorhynchus tshawytscha*), coho salmon (*O. kisutch*), and steelhead (*O. mykiss*). Catch data of other fishes are also presented.

Weekly stratified mark-recapture population estimates of emigrating age-0 Chinook salmon were calculated for both naturally and hatchery-produced sub-populations. At PTRST between January 13 and August 26, an estimated 1,922,326 (SD=146,568; CV = 0.08) naturally-produced age-0 Chinook salmon and 370,450 (SD = 38,768, CV = 0.10) age-0 hatchery Chinook salmon passed the site. At WCRST between March 5 and September 16, an estimated 3,047,673 (SD = 162,607; CV = 0.05) naturally-produced age-0 Chinook salmon and 907,892 (SD = 50,260; CV = 0.06) age-0 hatchery Chinook salmon passed the site.

Juvenile salmonid emigration target dates were developed for the Trinity River Restoration Program (TRRP) to assess at what date 80% of the juvenile salmonid population had reached Willow Creek and to help manage water temperatures in the mainstem Trinity River. The estimate of the week in which 80% of the juvenile Chinook salmon population passed WCRST, as inferred from the proportional discharge based abundance index was Week of the Year (WOY) 30 (July 23-July 29), which occurred after the TRRP management target date of July 9. The estimate of the week in which 80% of the natural coho salmon smolt population passed the WCRST was WOY 22 (May 28-June 3), which occurred prior to the TRRP management target date of June 4. The estimate of the week in which 80% of the steelhead smolt population passed the WCRST, as inferred from proportional discharge based abundance indices, was WOY 21 (May 15 – May 21), which occurred prior to the TRRP management target date of May 22.

Introduction

This report presents annual data collected to: (1) evaluate the production of juvenile salmonids, primarily Chinook salmon (*Oncorhynchus tshawytscha*), from the upper 65 kilometers of the mainstem Trinity River below Lewiston Dam, the primary restoration reach of the Trinity River Restoration Program (TRRP); and (2) evaluate the production and outmigrant timing of juvenile salmonids through the lower Trinity River in response to managed flow releases, the new thermal regimes, and restoration efforts. Information collected by this project is needed to address TRRP Integrated Assessment Plan objective 3, sub-objective 3.2 (TRRP and ESSA 2009):

Objective 3: Restore and maintain natural production of anadromous fish populations

Sub-objective 3.2: Increase freshwater production of anadromous fish.

In addition to quantifying salmonid outmigrant production and timing, fish condition and hatchery/natural composition of the outmigrants are assessed. The intent of this data series report is to provide timely dissemination of data to local managers and for inclusion in agency databases. A technical report synthesizing multi-year datasets developed by this project will be periodically published to evaluate trends in outmigrant salmonid production, outmigrant timing, hatchery/natural contribution and condition/health. Monitoring emigrating juvenile salmonid populations in conjunction with habitat availability and suitability studies is expected to provide a direct evaluation of restoration efforts because these studies focus on the early freshwater life-history phase which is directly affected by instream conditions and management actions.

For details on background, study site, and monitoring methods for the data presented in this report, the reader is referred to the 2009 Trinity River Juvenile Salmonid Outmigrant Monitoring Report.

Summary

Juvenile salmonid emigration from the mainstem Trinity River has been monitored since 1989 with rotary screw traps. This data series report summarizes the outmigrant monitoring data collected in 2011 cooperatively by the U.S. Fish and Wildlife Service, Arcata Fish and Wildlife Office, Hoopa Valley Tribal Fisheries Department, and Yurok Tribal Fisheries Program at Pear Tree Gulch (PTRST) and Willow Creek (WCRST) on the mainstem Trinity River (Figure 1). Data are grouped by Week of the Year (WOY; Table 1) to aid in cross year comparisons. Graphs of water temperature and discharge through the sampling periods are presented in Figure 2. It is intended that this information will provide basic biological information that can be used by managers to evaluate the effectiveness of habitat restoration efforts, especially flow regimes recommended in the Record of Decision (USDOI 2000), in restoring the fishery resources of the Trinity River.

Sampling Efforts

In 2011, trapping at PTRST began in the third week of January and trapping at WCRST was initiated the first week of March (Table 2). Sampling occurred at both sites in each sampling week, although occasionally traps were not run for complete sample weeks. To ensure that the greatest portion of the natural Chinook salmon emigration, as well as portions of the hatchery and natural coho salmon (*O. kisutch*) and steelhead (*O. mykiss*) smolt emigration, were sampled, efforts were made to install the traps as early as possible and continue sampling throughout the summer. This allowed comparable data to be collected for inter-annual comparisons in emigration timing (duration and peak) and abundance. Additionally, it is important to note that sampling a portion of the year (i.e. the spring/summer season) samples only a portion of the annual production, and all estimates of production refer only to the sampling period.

Catch Totals

Catch totals of the primary salmonids of interest (Chinook salmon, coho salmon and steelhead) are presented in Table 3. Hatchery salmonid releases are presented in Table 4. Catch totals of other fish species are presented in Table 5.

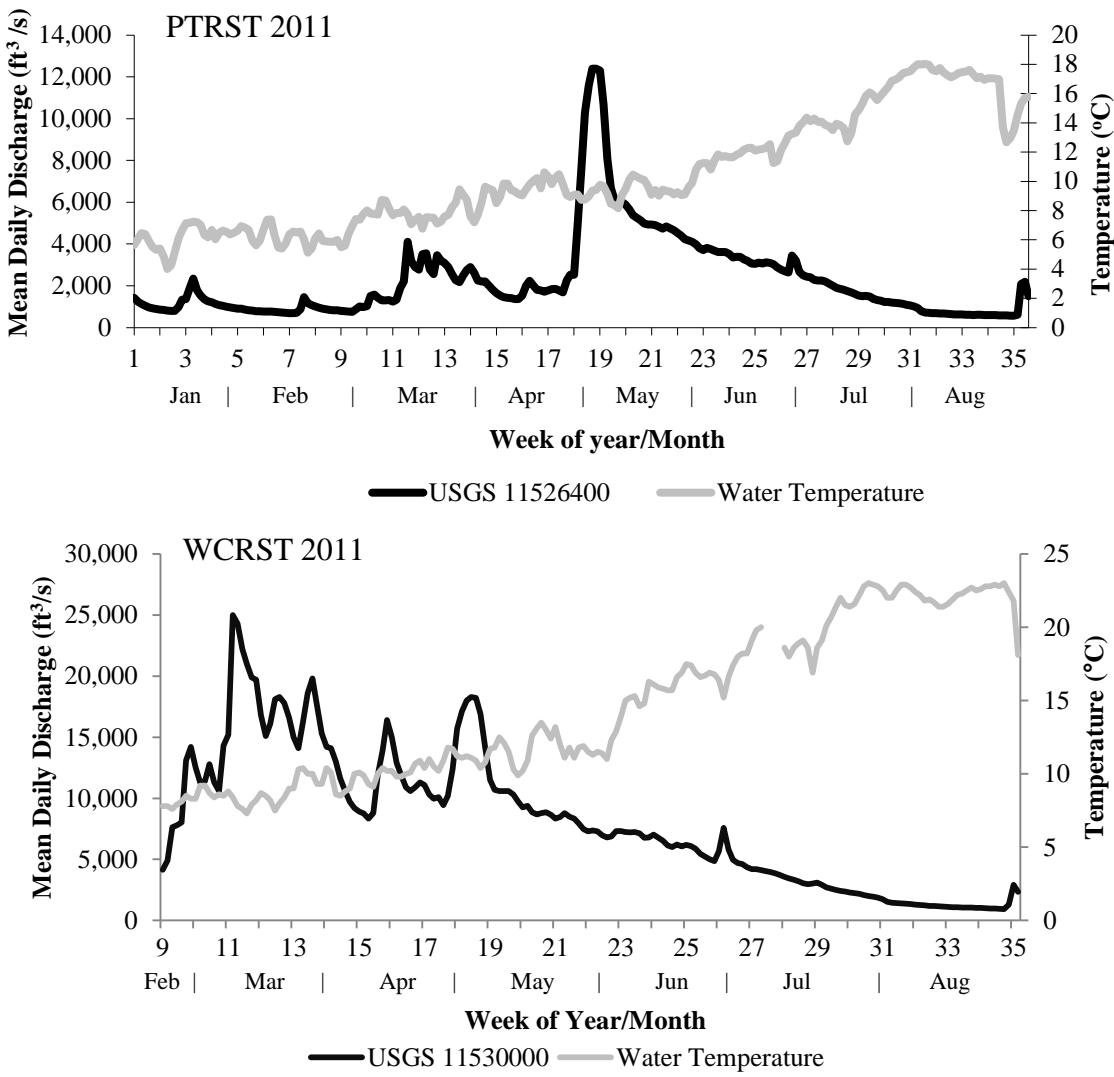

Figure 2. Mean daily discharge (ft^3/s) as recorded near Helena, California (U.S. Geological Survey Water Resource gauge station #11-526400) and Hoopa (HPA; U.S. Geological Survey Water Resource gauge station #11-530000), California and mean daily water temperatures ($^{\circ}\text{C}$) recorded at Pear Tree Rotary Screw Trap (PTRST) and Willow Creek Rotary Screw Trap (WCRST) in 2011.

Abundance Indices

The proportional discharge based abundance indices for natural age-0 Chinook salmon were approximately 1.05 million and 1.42 million at PTRST and WCRST, respectively (Figure 3; Table 6; Appendix 1 & 2). The age-0 hatchery Chinook salmon abundance indices were approximately 0.10 million at PTRST and 0.45 million at WCRST. It is unclear what caused the PTRST abundance index for hatchery Chinook salmon to be less than the WCRST estimate. This discrepancy was also observed in the mark-recapture population estimates. Future analyses will attempt to explain this difference. Because natural age-0 Chinook salmon were captured on the first day of trap operation in 2011, it is possible that a portion of the early spring natural age-0 Chinook salmon emigrated prior to trap installation.

Table 2. Period and duration of 2011 spring/summer monitoring and percent of time sampled at Pear Tree Rotary Screw Trap site (PTRST; rkm 118) and Willow Creek Rotary Screw Trap site (WCRST; rkm 34). Combined value is total number of days sampled with at least one trap.

Site	Trap	Start-End dates	Days Trapped	Days possible	Trapping Rate
PTRST	1 (2.4m)	13 Jan – 26 Aug	205	226	91%
PTRST	2 (1.5m)	13 Jan – 26 Aug	180	205	88%
Combined		13 Jan – 26 Aug	206	226	91%
WCRST	1 (2.4m)	05 Mar – 16 Sep	149	195	76%
WCRST	2 (2.4m)	05 Mar – 16 Sep	159	195	82%
WCRST	3 (2.4m)	05 Mar – 16 Sep	131	195	67%
Combined		05 Mar – 16 Sep	163	195	84%

Table 3. Juvenile salmonid catch totals in 2011 for trapping at Pear Tree Rotary Screw Trap (PTRST; rkm 118) and Willow Creek Rotary Screw Trap (WCRST; rkm 34), on the Trinity River, California, operated by the Hoopa Valley Tribal Fisheries Department, U. S. Fish and Wildlife Service, Arcata Fish and Wildlife Office and the Yurok Tribal Fisheries Program. NA = Not Applicable (i.e. no fish of a particular age class exist in the Trinity River).

WCRST	coho salmon	NA	55,855	8,002	5,263	NA	69,120
WCRST	steelhead	NA	78,141	2,514	66,190	5,089	151,934

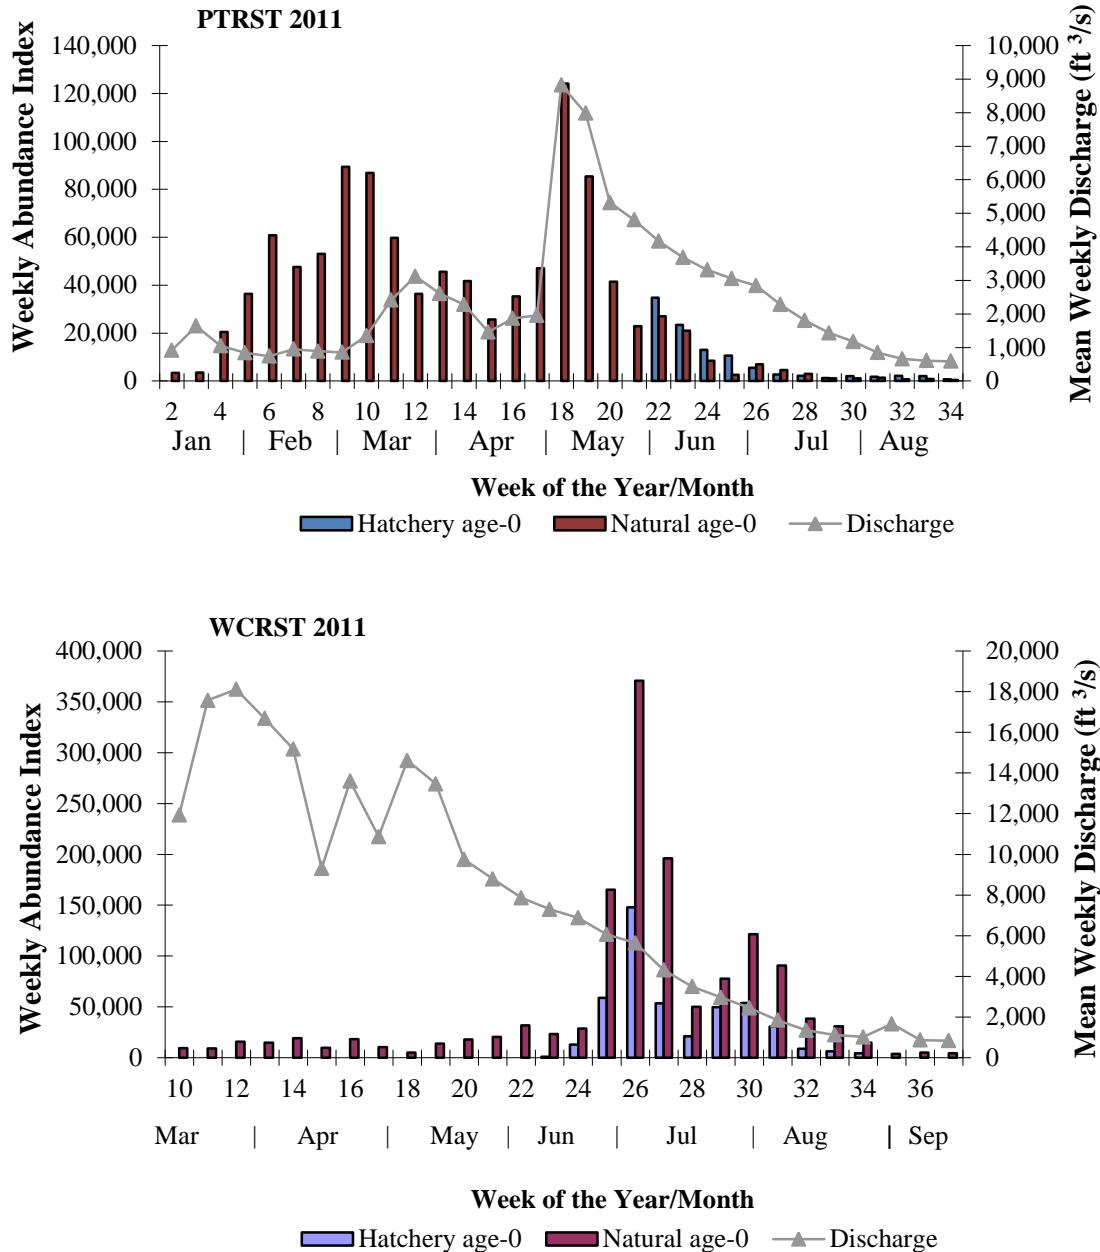

Figure 3. Weekly proportional discharge based abundance indices for natural age-0 and hatchery age-0 Chinook salmon captured at Pear Tree Rotary Screw Trap (PTRST; rkm 118) and Willow Creek Rotary Screw Trap (WCRST; rkm 34) in 2011. Mean daily discharge (ft³/s) was recorded by U.S. Geological Survey Water Resource gauge station #11-526400, near Helena, California, and U.S. Geological Survey Water Resource gauge station #11-530000 at Hoopa, California. Please note differences in scale of axes.

The proportional discharge based abundance indices for age 1+ naturally produced coho salmon were 764 and 5,263 fish at the PTRST and WCRST, respectively (Figure 4; Table 6; Appendix 3 & 4). The age-0 naturally produced coho salmon abundance indices were 13,559 and 8,002 for PTRST and WCRST, respectively. The abundance indices for hatchery age-1 coho salmon were 2,395 and 55,855 for PTRST and WCRST, respectively. The value for age-1 hatchery coho salmon for the WCRST was greater than that for PTRST for an unknown reason.

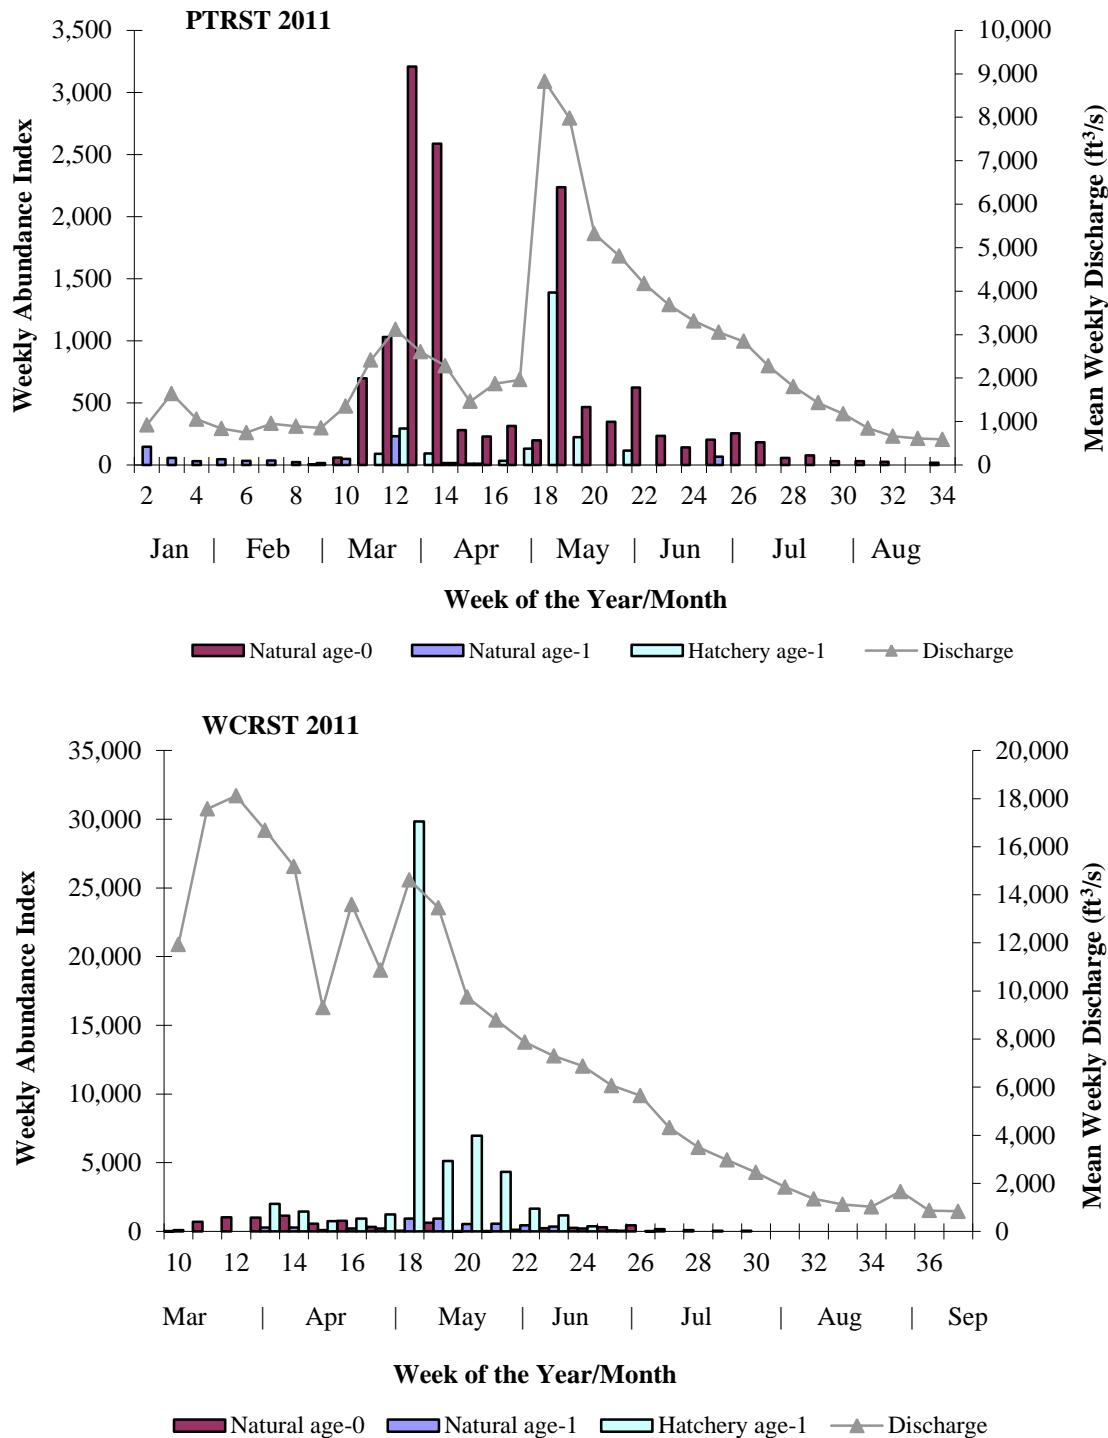

Figure 4. Weekly proportional discharge based abundance indices for natural age-0, natural age-1, and hatchery age-1 coho salmon captured at Pear Tree Rotary Screw Trap (PTRST, rkm 118) and Willow Creek Rotary Screw Trap (WCRST, rkm 34) in 2011. Mean daily discharge (ft³/s) was recorded by U.S. Geological Survey Water Resource gauge station #11-526400, near Helena, California, and U.S. Geological Survey Water Resource gauge station #11-530000 at Hoopa, California. Please note differences in scale of axes.

Future analyses will attempt to explain this difference. Since natural age-1+ coho salmon were captured at the beginning of the sampling period at both trap sites, it is likely that portions of each respective population emigrated prior to trap installation. Additionally, any outmigration that may occur in the fall of age-0 coho salmon is not accounted for because sampling typically ends in late August.

For the PTRST, proportional discharge based abundance indices for natural age-0 and age-1 steelhead were 8,910 and 20,978, respectively (Figure 5; Table 6; Appendix 5). The abundance indices for age-0 and age-1 steelhead at the WCRST were 2,514 and 66,190, respectively (Figure 5; Table 6; Appendix 6). The abundance indices for hatchery age-1 steelhead were 17,394 for the PTRST and 78,141 for the WCRST; again showing the unexplained pattern of higher values for the lower trapping site. Future analyses will attempt to explain this difference. As with coho salmon, the sampling period at both trap sites misses portions of each respective population that emigrated prior to or after trapping operations. Additionally, any outmigration that may occur in the fall of age-0 steelhead is not accounted for because sampling typically ends in late August.

Chinook Salmon Population Estimation

During the 2011 sampling season, freeze branded hatchery Chinook salmon were used to estimate capture efficiency to generate population estimates during the sampling period (Appendix 7 & 8). Weekly stratified mark-recapture population estimates of emigrating age-0 Chinook salmon were calculated for both naturally and hatchery-produced sub-populations. At PTRST between January 13 and August 26, an estimated 1,922,326 ($SD=146,568$; $CV = 0.08$) naturally-produced age-0 Chinook salmon and 370,450 ($SD = 38,768$; $CV = 0.10$) age-0 hatchery Chinook salmon passed the site. At WCRST between March 5 and September 16, an estimated 3,047,673 ($SD = 162,607$; $CV = 0.05$) naturally-produced age-0 Chinook salmon and 907,892 ($SD = 50,260$; $CV = 0.06$) age-0 hatchery Chinook salmon passed the site.

It is likely that the WCRST estimate of naturally produced Chinook was higher in part due to recruitment of juvenile Chinook salmon from tributaries (i.e. North Fork Trinity River, South Fork Trinity River, and Willow Creek) and mainstem spawning below PTRST, but we cannot account for why the hatchery estimate was higher at WCRST compared to PTRST. Future analyses will attempt to explain this difference.

Hatchery/Natural Contribution

Chinook salmon were captured at PTRST and WCRST throughout the 2011 sampling season with the spring/summer emigration dominated by naturally-produced fish comprising 91% and 76%, respectively, of the total proportional discharge based abundance indices (Appendix 1 & 2).

The age-1 coho salmon emigration was composed primarily of hatchery-produced fish at PTRST, comprising 76% of the total age-1 proportional discharge based index in 2011 (Appendix 3), and dominated by hatchery-produced fish at WCRST, comprising 91% of the total age-1 proportional discharge based index in 2011 (Appendix 4).

Based on proportional discharge based abundance indices at PTRST and WCRST, the age-1 hatchery steelhead hatchery produced fish comprised 45% (Appendix 5) and 54% (Appendix 6), of the total age-1 abundance indices, respectively.

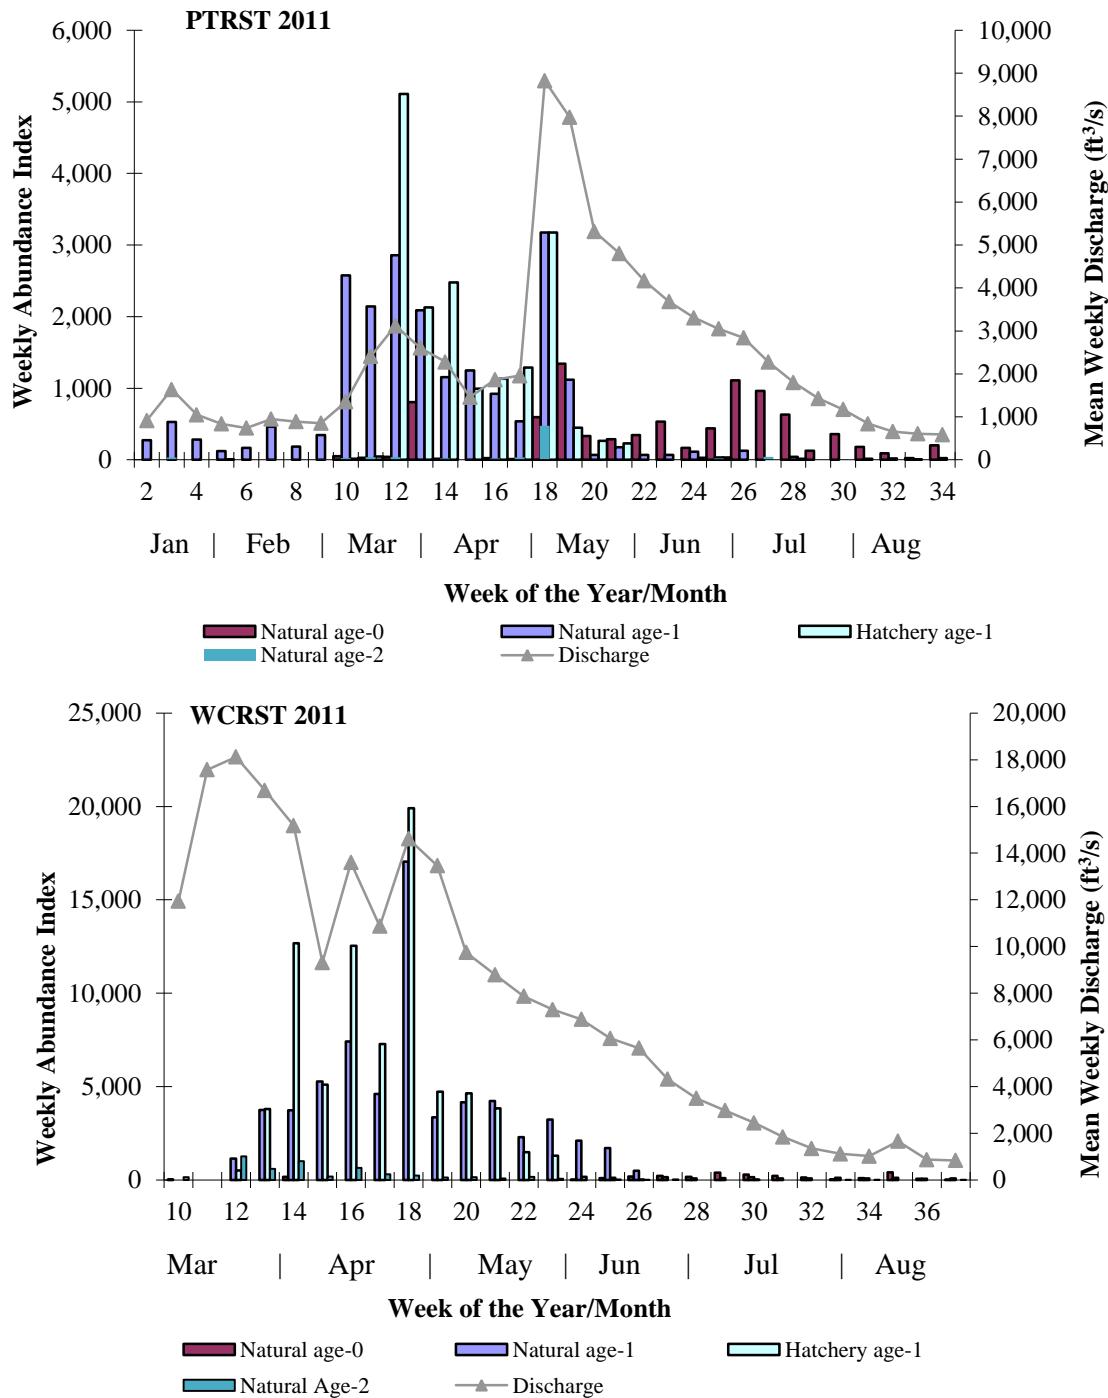

Figure 5. Weekly proportional discharge based abundance indices for natural age-0, natural age-1, natural age-2, and hatchery age-1 steelhead captured at Pear Tree Rotary Screw Trap (PTRST, rkm 118) and Willow Creek Rotary Screw Trap (WCRST, rkm 34) in 2011. Mean daily discharge (ft^3/s) was recorded by U.S. Geological Survey Water Resource gauge station #11-526400, near Helena, California, and U.S. Geological Survey Water Resource gauge station #11-530000 at Hoopa, California. Please note differences in scale of axes.

Outmigrant Timing

The Chinook salmon population in the Trinity River is composed of both naturally-produced and hatchery-produced fish of both spring and fall races. The vast majority of juveniles during the spring/summer emigration period emigrate as age-0 fish, with the natural and hatchery emigration periods overlapping (Table 7; Appendix 1 & 2). The week marking the cumulative passage of 80% of the natural juvenile Chinook salmon population at WCRST, as inferred from the proportional discharge based abundance index, was WOY 30 (July 23-July 29), which occurred after the TRRP management target date of July 9 (TRRP and ESSA 2009). Based on proportional discharge based abundance indices, the natural age-0 Chinook salmon emigration had two peaks at PTRST in WOY 9 and 18, and had multiple peaks at WCRST occurring in WOY 14, 26, and 30. The hatchery age-0 Chinook salmon emigration peaked in WOY 22 at PTRST and WOY 26 at WCRST.

The coho salmon population in the Trinity River is composed of both naturally-produced and hatchery populations. The vast majority of Trinity River coho salmon emigrate to the ocean as age-1 smolts while the emigration of age-0 fish is presumably a redistribution of juveniles rearing in the mainstem. Natural age-1 coho salmon emigrated through the Trinity River at PTRST and WCRST beginning prior to trap installation and continued through mid-July in 2011, while hatchery age-1 coho salmon emigrated following their release in early April through late June (Table 7; Appendix 3 & 4). Interpretation of the data suggests that the sampling period did not encompass the entire naturally-produced age-1 coho salmon emigration period at WCRST. It is possible that these naturally-produced age-1 coho salmon spend extended rearing in the Trinity Basin and emigrate in the late fall as larger individuals. The week marking the cumulative passage of 80% of the naturally produced age-1 coho population at WCRST, as inferred from the proportional discharge based index, was WOY 22 (May 28-June 3), which occurred prior to the TRRP management target date of June 4 (TRRP and ESSA 2009). Natural age-0 coho salmon emigration peaked in WOY 13 at PTRST and WOY 14 at WCRST. Natural age-1 coho salmon emigration peaked in WOY 12 at PTRST and WOY 19 at WCRST. Hatchery coho salmon emigration peaked in WOY 18 at PTRST and WOY 18 at WCRST.

The steelhead populations (summer, fall, and winter races) in the Trinity River are composed of both natural populations that exhibit highly variable juvenile life history patterns, as well as a hatchery-produced component. All age classes of steelhead were generally captured throughout the sampling season at PTRST and WCRST, with peaks in abundance occurring during the early portion of sampling for age-1, and in July for age-0 fish. Age-1 or older natural steelhead were present throughout the sampling period (Table 7; Appendix 5 & 6). The majority of hatchery-produced age-1 steelhead emigrated by the end of June. As with coho salmon smolts, it is likely that naturally-produced age-1 steelhead exhibit extended rearing in the Trinity Basin and emigrate in the fall/winter as larger individuals. The week marking the cumulative passage of 80% of the natural steelhead smolt population at WCRST, as inferred from proportional discharge based abundance indices, was WOY 21 (May 15 – May 21), which occurred prior to the TRRP management target date of May 22 (TRRP and ESSA 2009). Natural age-0 steelhead emigration peaked in WOY 19 at PTRST and WOY 35 at WCRST. Natural age-1 steelhead emigration peaked in WOY 18 at PTRST and WOY 18 at WCRST. Hatchery steelhead emigration peaked in WOY 12 at PTRST and WOY 18 at WCRST.

Table 7. Juvenile salmonid emigration duration and peak as inferred from proportional discharge based abundance indices, at Pear Tree Rotary Screw Trap (PTRST) and Willow Creek Rotary Screw Trap (WCRST), 2011. Values represent week of the year.

Site	Species	Emigration Duration			Emigration Peak		
		Natural Age-0	Natural Age-1+	Hatchery	Natural Age-0	Natural Age-1+	Hatchery
PTRST	Chinook salmon	2-34	3-20	22-34	9, 18	19	22
PTRST	coho salmon	9-34	2-25	11-21	13	12	18
PTRST	steelhead	10-34	2-34	12-28	19	18	12
WC	Chinook salmon	10-37	13-17	23-37	14, 26, 30	15	26
WC	coho salmon	10-30	10-25	13-26	14	19	18
WC	steelhead	10-37	10-37	12-30	35	18	18

Migration Rate

Maximum migration rates of all salmonids are presented in Table 8. These values should be considered maximums, as hatchery fish are released on a volitional basis from the Trinity River Hatchery.

Fish Size

Chinook salmon fork lengths generally increased through the season at both PTRST and WCRST (Figure 6; Appendix 9 & 10).

Natural coho salmon fork lengths generally increased through the sampling season at both PTRST and WCRST (Figure 7; Appendix 9 & 10), however, hatchery coho salmon fork lengths generally decreased through the sampling season at WCRST.

Natural steelhead fork lengths generally increased through the sampling season at both PTRST and WCRST (Figure 8; Appendix 11 & 12), however, hatchery steelhead fork lengths generally decreased through the sampling season at WCRST.

Fish Condition

Fulton's condition factor ($K = 100,000 * (\text{weight} / \text{length}^3)$) was calculated on a subsample of age-0 Chinook salmon larger than 50 mm (Appendix 13), age-1 coho salmon (Appendix 14), and age 1+ steelhead (Appendix 15). Due to the inability to determine if an unmarked Chinook salmon was of hatchery origin, all juvenile Chinook salmon are pooled in weekly mean calculations. Weekly mean condition factor of juvenile Chinook salmon generally increased through the season. Coho salmon condition factor data presented are hatchery and natural combined due to the small sample size of natural origin coho salmon. Weekly mean condition factor of juvenile coho salmon generally remained level through the season. Weekly mean condition factor of steelhead generally remained level through the sampling season.

Table 8. Juvenile salmonid maximum migration rate from Trinity River Hatchery to Pear Tree Rotary Screw Trap (PTRST) and Willow Creek Rotary Screw Trap (WCRST) sampling sites, operated by the Hoopa Valley Tribal Fisheries Department, U. S. Fish and Wildlife Service, Arcata Fish and Wildlife Office, and the Yurok Tribal Fisheries Program, 2011.

Site	Species	Date First Released	Date First Captured	# of Days	Maximum Migration Rate
PTRST	Chinook salmon	06/01/2011	06/02/2011	1	64 rkm/day
PTRST	coho salmon	03/15/2011	03/17/2011	2	32 rkm/day
PTRST	steelhead	03/15/2011	03/17/2011	2	32 rkm/day
WCRST	Chinook salmon	06/01/2011	06/07/2011	6	18 rkm/day
WCRST	coho salmon	03/15/2011	03/30/2011	15	7 rkm/day
WCRST	steelhead	03/15/2011	03/23/2011	8	14 rkm/day
